TIME MANAGER

MOBILE

TIME MANAGER

Develop a **mobile** version of your web app.

> Every page must have a mobile version, except dashboards.

It should handle **authentication** and be available in **offline mode** with automatic synchronisation when the user reconnects.

You can use the *local storage* of the mobile and/or a database (sqlite or nosql).

> With the arrival and departure being done with a request, how can it work when the user is offline?

For the navigation, prefer a tab bar to a burger menu; it is better on engagement; satisfaction and speed.

> Use as many native features as possible to improve the look-and-feel of your application.
